# The Elementary Particle Entity Notation (PEN) Scheme 

Michel Goossens and Eric van Herwijnen

#### Abstract

In this article an Elementary Particle Entity Notation (PEN) scheme is proposed for use with $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ and SGML. This scheme not only assures the typographic correctness of the printed symbols, but also eases the automatic extraction of information about the article by the recognition of the entity names.

## 1 Typographical rules for scientific texts

In scientific texts the printed form of a symbol often implies a meaning which is not easily captured by generic markup. Therefore authors using some form of generic coding (like LATEX or SGML) need to know about typographical conventions. The following is a brief summary of the most important rules for composing scientific texts [1, 2].

1. The most important rule is consistency: a symbol should always be the same, whether it appears in a formula or in the text, on the main line or as a superscript or subscript. That is, in $\mathrm{T}_{E} \mathrm{X}$, once you have used a symbol inside mathematics mode (' $\$$ '), always use it inside mathematics mode. Inside math mode, $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ by default prints characters in italics.

For scientific work, however, quite a few symbols must be set in roman (upright) characters ${ }^{1}$. This is the case for the following families of symbols, which represent the names of:

- units, such as g, cm, s, keV. Note that physical constants are usually in italics, so units involving constants are mixed roman-italics, e.g. $\mathrm{GeV} / c$ (where the $c$ is italic because it symbolizes the speed of light, a constant);
- particles, for example p, K, q, H. For elementary particles the PEN (Particle Entity Notation) scheme is proposed (see the next section);
- standard mathematical functions (sin, det, cos, tan, Re, Im, etc.). Use the built-in $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ functions for these ( $\backslash$ sin, etc.) ;
- chemical elements, for example $\mathrm{Ne}, \mathrm{O}, \mathrm{Cu}$;
- numbers;
- names of waves or states ( p -wave) and covariant couplings (A for axial, V for vec-

## ${ }^{1}$ With IATEX roman type in maths mode can be

 achieved by the \mbox or $\backslash$ mathrm commands.tor), names of monopoles (E for electric, M for magnetic);

- abbreviations that are initials or bits of words (exp, for experimental; min, for minimum);
- the ' d ' in integrands (e.g. $\mathrm{d} p$ ).

In all cases, following these rules will help the reader understand at first glance what one is talking about. Some instances in which it is important to use the correct symbol, in the correct type, are shown in Table 1.
2. Let your word processor do as much work as it can. Do not try to change your system's defaults too much; this will decrease the portability and maintainability of your documents. TEX implements a lot of the rules mentioned above by default in math mode.
3. Do not add blanks at random to make formulae look "nicer".
4. Refrain from using specific page layout commands (like \break with $\mathrm{T}_{\mathrm{E} X}$ ). You will forget that you put them in your text and later wonder why some text is badly adjusted or starts a new line.

## 2 Entity definitions for elementary particles

In texts on high energy physics frequently reoccurring strings are the names of elementary particles. For example, the $\mathrm{Z}^{0}$ particle can be coded in various different ways with $I^{A T} \mathrm{E}_{\mathrm{E}} \mathrm{X}$ : $\$ \backslash$ mbox $\{\mathrm{Z}\}^{\sim} 0 \$$, $\$ \backslash$ mathrm\{Z~0\}\$ and $Z \${ }^{-0 \$}$ all achieve the same typographical effect, a roman $Z$ with a superscript 0 . In the interest of standardization and typing convenience, we propose below an "entity" naming scheme, which will not only relieve the user from having to worry about the correctness of what he types, but also will allow an automatic extraction of the particle names from the input file, so that it will be easy to enter data about an article using this convention into a database of abstracts.

The naming scheme uses a notation which takes the following constraints into consideration:

1. The notation should be able to describe all particles in the particle data summary tables from the "Review of Particle Properties" [3] and any future extension to these.
2. The names should not exceed eight characters. This is the maximum length for entities in the SGML reference concrete syntax [4]. Staying within this limit means that the notation can be used with most SGML applications.

| roman type | italic type |
| :---: | :---: |
| A ampere (electric unit) | $A$ atomic number (variable) |
| e electron (particle name) | $e$ electron charge (constant) |
| g gluon (particle name) | $g$ gravitational constant |
| 1 litre (volume unit) | $l$ length (variable) |
| $m$ metre (length unit) | $m$ mass (variable) |
| $p$ proton (particle name) | $p$ momentum (variable) |
| q quark (particle name) | $q$ electric charge (variable) |
| $s$ second (time unit) | $s$ c.m. energy squared (variable) |
| t tonne (weight unit) | $t$ time (variable) |
| $V$ volt (electric unit) | $V$ volume (variable) |
| Z Z boson (particle name) | $Z$ atomic charge (variable) |

Table 1: Example of differences in meaning of a symbol depending on the type.
3. Common particles such as protons and electrons should have short and simple names.
4. Items that are indicated by superscripts are indicated before items that are indicated by subscripts.
Due to the eight character limitation the mass could not be added to the name. This means that in general an entity on its own is not adequate to unambiguously identify a particle, cf. $\eta(549)$ and $\eta(1300)$ are both referred to as Pgh. Including mass dependences into the names is not a good idea anyway, since the mass can change with time when more precise measurements become available. The ambiguity was solved by adding a letter to the end of the name where a mass appears in the name in the particle data summary tables. Thus $\eta(549)$ is referred to as Pgh while $\eta(1300)$ is referred to as Pgha. Higher letters correspond to higher masses, in the order given in the tables.

The PEN scheme is independent of any text processing system. We have implemented it in $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ (in such a way that it may be used in all macro packages, e.g. $I_{A} T_{E} X$ ) and SGML. The $T_{E X}$ implementation will print particle masses, which will be regularly updated according to the Review of Particle Properties publication. It is constructed so that the PEN name can be used in both mathematics and text mode.

### 2.1 Principles of the Particle Entity Notation (PEN)

Starting at the left, a name is built from the following characters:

1. Start the entity with a recognized string (in the following this was chosen as uppercase $P$ ). This is necessary to uniquely identify entities as following the PEN convention.
2. The following letters act as an escape to signal a special interpretation of the string. Present escape sequences are:

- a for anti particle (normally represented visually with a bar over the particle's name)
- b for bottom particle
- c for charmed particle
- g for indicating the subsequent letter is Greek. The correspondence between Latin and Greek letters is based on the notation for mathematical Greek characters used by the AAP mathematical formula application [5]:

```
<!NOTATION greek2 PUBLIC "+//ISBN
            1-880124::NISO//NOTATION GREEK-2//EN">
```

This one-letter correspondence is shown in Table 2.

- q for quark particle
- s for strange particle
- S for supersymmetric particle
- t for top particle

3. The one-letter name of the particle
4. Optionally followed by other information

- z for zero, i for one, ii for two, iii for three, iv for four
- m for minus, p for plus, pm for plus/minus
- pr for prime
- st for asterisk (star)
- L for left-handed, R for right-handed
- any one-letter particle name

| Greek | name | code | Greek | name | code |
| :---: | :--- | :---: | :---: | :--- | :---: |
| $\alpha$ | alpha | a | A | Alpha | A |
| $\beta$ | beta | b | B | Beta | B |
| $\gamma$ | gamma | g | $\mathrm{\Gamma}$ | Gamma | G |
| $\delta$ | delta | d | $\Delta$ | Delta | D |
| $\epsilon$ | epsilon | e | E | Epsilon | E |
| $\zeta$ | zeta | z | Z | Zeta | Z |
| $\eta$ | eta | h | H | Eta | H |
| $\theta$ | theta | q | $\Theta$ | Theta | Q |
| $\iota$ | iota | i | I | Iota | I |
| $\kappa$ | kappa | k | K | Kappa | K |
| $\lambda$ | lambda | l | $\Lambda$ | Lambda | L |
| $\mu$ | mu | m | M | Mu | M |
| $\nu$ | nu | n | N | Nu | N |
| $\xi$ | xi | x | $\Xi$ | Xi | X |
| $o$ | omicron | o | O | Omicron | O |
| $\pi$ | pi | p | $\Pi$ | Pi | P |
| $\rho$ | rho | r | P | Rho | R |
| $\sigma$ | sigma | s | $\Sigma$ | Sigma | S |
| $\tau$ | tau | t | T | Tau | T |
| $v$ | upsilon | u | $\Upsilon$ | Upsilon | U |
| $\phi$ | phi | f | $\Phi$ | Phi | F |
| $\chi$ | chi | c | X | Chi | C |
| $\psi$ | psi | y | $\Psi$ | Psi | Y |
| $\omega$ | omega | W | $\Omega$ | Omega | W |

Table 2: The AAP codes for the Greek letters.

### 2.2 Particle encodings according to the PEN Scheme

In table 3 we show how to encode the particles from the summary tables of particle properties in the "Review of Particle Properties" [3] using the PEN convention. In the rightmost column we give the computer name of the particle, as defined by "A Guide to Experimental Elementary Particle Physics Literature (1985-1989)" [6]. This is the name to be used when searching the Particle Data Group's databases. Notice that these names cannot be used for either TEX or SGML, as they do not satisfy the constraints of the PEN scheme as defined above. When a name is marked as "not available", sometimes a charged or neutral version exists (not given in the table).

The $\mathrm{TEX}_{\mathrm{E}}$ implementation is available as a style file pennames.sty, which should be input in the usual way at the start of the document for TEX or specified as a minor option on the \documentstyle command for IATEX. To obtain the symbol required, prefix the PEN name by a backslash (' $\backslash$ ').

The SGML implementation exists as a public entity set, that can be included in SGML documents with the following entity definition:

```
<!ENTITY % PEN PUBLIC
    "+//ISBN 92-9083-041-7::CERN//ENTITIES
        Particle Entity Names//EN">
```

Refer to a particle entity by prefixing its name by an ampersand (' $\&$ ') and suffixing it with a semi-colon (';'), e.g. \&Pgr; would give $\rho(770)$.

## 3 How to get the files

A file pennames.sty with the $\mathrm{TEX}_{\mathrm{E}}$ particle name definitions, pennames.entities with the SGML entity names, and pennames.ps containing the PostScript source of this document, are available via anonymous ftp as follows (commands to be typed by the user are underlined):

```
ftp cernvm.cern.ch
Trying 128.141.2.4...
220-FTPIBM at cernvm.CERN.CH...
Name (cernvm:goossens): anonymous
230 ANONYMOU logged in with no special a...
Remote system type is VM.
ftp> cd tex. }80
250 Working directory is TEX 802 (ReadOnly)
ftp> get pennames.sty
ftp> get pennames.entities
ftp> get pennames.ps
ftp> quit
```

| PgDj | $\Delta(1950) \mathrm{F}_{37}$ | Delta (1950) F 37 | not available |
| PgDk | $\Delta(2420) \mathrm{H}_{3,11}$ | Delta (2420) H 3,11 | not available |
| $\Lambda$ Baryons ( $\mathrm{S}=-1, \mathrm{I}=0$ ) |  |  |  |
| PgL | $\Lambda$ | Lambda | LAMBDA |
| PgLa | $\Lambda(1405) \mathrm{S}_{01}$ | Lambda (1405) S 01 | LAMBDA (1405S01) |
| PgLb | $\Lambda(1520) \mathrm{D}_{03}$ | Lambda (1520) D 03 | LAMBDA (1520D03) |
| PgLc | $\Lambda(1600) \mathrm{P}_{01}$ | Lambda (1600) P 01 | not available |

Table 3: PEN names (continued)

| PEN | symbol | conventional name | computer name |
| :---: | :---: | :---: | :---: |
| PgLd | $\Lambda(1670) \mathrm{S}_{01}$ | Lambda (1670) S 01 | not available |
| PgLe | $\Lambda(1690) \mathrm{D}_{03}$ | Lambda (1690) D 03 | not available |
| PgLf | $\Lambda(1800) \mathrm{S}_{01}$ | Lambda (1800) S 01 | not available |
| PgLg | $\Lambda(1810) \mathrm{P}_{01}$ | Lambda (1810) P 01 | not available |
| PgLh | $\Lambda(1820) \mathrm{F}_{05}$ | Lambda (1820) F 05 | not available |
| PgLi | $\Lambda(1830) \mathrm{D}_{05}$ | Lambda (1830) D 05 | not available |
| PgLj | $\Lambda(1890) \mathrm{P}_{03}$ | Lambda (1890) P 03 | not available |
| PgLk | ^(2100) $\mathrm{G}_{07}$ | Lambda (2100) G 07 | not available |
| PgLI | $\Lambda(2110) \mathrm{F}_{05}$ | Lambda (2110) F 05 | not available |
| PgIm | $\Lambda(2350) \mathrm{H}_{09}$ | Lambda (2350) H 09 | not available |
| $\Sigma$ Baryons ( $\mathrm{S}=-1, \mathrm{I}=1$ ) |  |  |  |
| PgSp | $\Sigma^{+}$ | Sigma plus | SIGMA+ |
| PgSz | $\Sigma^{0}$ | Sigma zero | SIGMAO |
| PgSm | $\Sigma{ }^{-}$ | Sigma minus | SIGMA- |
| PgSa | $\Sigma(1385) \mathrm{P}_{13}$ | Sigma (1385) P 13 | not available |
| PgSb | $\Sigma(1660) \mathrm{P}_{11}$ | Sigma (1660) P 11 | not available |
| PgSc | $\Sigma(1670) \mathrm{D}_{13}$ | Sigma (1670) D 13 | not available |
| PgSd | $\Sigma(1750) \mathrm{S}_{11}$ | Sigma (1750) S 11 | not available |
| PgSe | $\Sigma(1775) \mathrm{D}_{15}$ | Sigma (1775) D 15 | not available |
| PgSf | $\Sigma(1915) \mathrm{F}_{15}$ | Sigma (1915) F 15 | not available |
| PgSg | $\Sigma(1940) \mathrm{D}_{13}$ | Sigma (1940) D 13 | not available |
| PgSh | $\Sigma(2030) \mathrm{F}_{17}$ | Sigma (2030) F 17 | not available |
| PgSi | $\Sigma(2050)$ | Sigma (2250) | not available |
| $\Xi$ Baryons ( $\mathrm{S}=-2, \mathrm{I}=1 / 2$ ) |  |  |  |
| PgXz | $E^{0}$ | Xi zero | XIO |
| PgXm | $\Xi^{-}$ | Xi minus | XI- |
| PgXa | $\Xi(1530) \mathrm{P}_{13}$ | Xi (1530) P 13 | not available |
| PgXb | $\Xi(1690)$ | Xi (1690) | not available |
| PgXc | $\Xi(1820) \mathrm{D}_{13}$ | Xi (1820) D 13 | not available |
| PgXd | $\Xi(1950)$ | Xi (1950) | not available |
| PgXe | $\Xi(2030)$ | Xi (2030) | not available |
| $\Omega$ Baryons ( $\mathrm{S}=-3, \mathrm{I}=\mathbf{0}$ ) |  |  |  |
| PgOm | $\Omega^{-}$ | Omega minus | OMEGA- |
| Pgoma | $\Omega(2250)^{-}$ | Omega (2250) minus | OMEGA(2250)- |
| Charmed Baryons ( $\mathrm{C}=+1$ ) |  |  |  |
| PcgLp | $\Lambda_{c}^{+}$ | charmed Lambda plus | LAMBDA/C+ |
| PcgXz | $\Xi_{\mathrm{c}}^{0}$ | charmed Xi zero | not available |
| PcgXp | $\Xi_{c}^{+}$ | charmed Xi plus | not available |
| PcgS | $\Sigma_{\mathrm{c}}(2455)$ | charmed Sigma 2455 | not available |
| Supersymmetric Particles |  |  |  |
| PSgg | $\tilde{\gamma}$ | photino | PHOTINO |
| PSgxz | $\tilde{\chi}_{i}^{0}$ | neutralino | NEUTRALINO |
| PSZz | $\tilde{\mathrm{Z}}^{0}$ | supersymmetric Z zero | ZINO |
| PSHz | $\tilde{H}_{j}^{0}$ | Higgsino | HIGGSINO |
| PSgxpm | $\tilde{\chi}^{ \pm{ }^{\text {Ti }}}$ | chargino | chargino |
| PSWpm | $\tilde{W}^{ \pm}$ | supersymmetric W plus/minus | not available |
| PSHpm | $\tilde{\mathrm{H}}^{ \pm}{ }^{\text {j }}$ | charged Higgsino | not available |
| PSgn | $\tilde{\nu}$ | scalar neutrino | not available |
| PSe | ẽ | scalar electron | not available |
| PSgm | $\tilde{\mu}$ | scalar muon | not available |
| PSgt | $\tilde{\tau}$ | scalar tau | not available |
| PSq | $\underline{\mathrm{q}}$ | scalar quark | not available |
| PSg | $\underline{\mathrm{g}}$ | gluino | GLUINO |
