The abstract notes "... starting with almost every  $x_1$  (in the sense of Lebesgue measure) and *iterating* the function  $f(x) = 4 \cdot (1 - x)$  one obtains a sequence of numbers on  $(0, 1)$  with a computable algebraic distribution. By playing suitable games with numbers 'drawn' in this fashion, one can obtain various other distributions, either given explicitly or satisfying given differential or integral equations."
